

[Portfolio, 2026]

Hi there, I'm

Ivan Gromov.

A **software engineer** based in Helsinki. I work across the **full stack**, with a love for great user experience. Here is [some of my recent work](#).

• Open to new work

[A bit about me]

I like working across [the whole product], from the interface someone uses to the systems running behind it.

Right now I'm building industrial software at Navis Engineering and a logistics SaaS platform at ALISA Software, a startup. Before that I led the frontend at Hiava, which later grew into ALISA Software itself.

I care about clean design, readable code, and shipping things people actually use. I like taking a rough idea all the way to something finished and well made, on my own or in a tight loop with the people around me.

BASED IN

Helsinki, Finland

DOING

Full-Stack Development

CURRENTLY AT

Navis Engineering and ALISA Software

STUDIED

B.Eng. in IT, Metropolia UAS

ALISA Software Portal

Multi-carrier shipping software · SaaS · B2B

ALISA brings shipment booking, labels and tracking from different carriers into one platform. Explore it live at portal.alisasoftware.fi

Multi-carrier shipping software

React · TypeScript · Python · Node.js · PostgreSQL · MongoDB · Kubernetes

I develop the product end to end, from design and UX to backend services and integrations. In collaboration with: business lead, customers, and developers from partner shipping companies.

[ALISA Software Portal]

Creating a shipment

A guided, step-by-step flow across our carrier integrations (incl. Posti, DHL, and PostNord), so a long multi-carrier booking stays easy to complete.

Application for controlling ships remotely

React · TypeScript · Web Components · C++ · WebSockets · OpenBridge

A web application for monitoring and operating ships from shore and on bridge. Clarity is a safety requirement, not a nice-to-have.

Application for controlling ships remotely

I lead the development from frontend to backend APIs, the real-time data integration, and the component library behind the UI.

Internal platform for project configuration

React · TypeScript · Django · Python · SQL

An internal platform for ship configuration that replaced the legacy application. Made 500+ interdependent settings stay consistent, as daily project configurations take shape.

Internal platform for project configuration

Redesign made the same routine work faster and easier to trust. I rebuilt the platform around a set of custom components and UX patterns, keeping the familiar workflow people already knew.

Build Documents

I build software and improve how it gets built.

Alongside building products, I develop reusable workflows around agentic tooling, custom skills, and MCP integrations.

Connecting tools and systems

I connect agentic tools to documentation, databases, and cloud infrastructure to support development and troubleshooting across systems.

Automation with checks built in

I build verification and review into these workflows, checking that changes meet requirements and behave correctly in the application.

Keeping context together

I document project conventions and the reasoning behind technical decisions, giving developers and agents a shared reference.

Useful beyond my own setup

I introduce useful tools and share the workflows I build, helping colleagues adapt them to their everyday development work.

[Thank you for reading]

Let's talk.

If any of this resonates, I'd be glad to hear from you.
