

Hi there, I'm

Ivan Gromov.

A software engineer based in Helsinki. I work across the **full stack**, with a love for **frontend and good UX**. Here's a look at what I actually build.

• Open to new work

[A bit about me]

I like working across [the whole product], from the interface someone uses to the systems running behind it.

Right now I'm building industrial software at Navis Engineering and a logistics SaaS platform at ALISA Software, a startup. Before that I led the frontend at Hiava, which later grew into ALISA Software itself.

I care about clean design, readable code, and shipping things people actually use. I like taking a rough idea all the way to something finished and well made, on my own or in a tight loop with the people around me.

BASED IN

Helsinki, Finland

DOING

Frontend and Full-Stack

CURRENTLY AT

Navis Engineering and ALISA Software

STUDIED

B.Eng. in IT, Metropolia UAS

[ALISA Software]

ALISA Software Portal

Multi-carrier shipping software · SaaS · B2B

ALISA brings shipment booking, labels and tracking from different carriers into one platform. Explore it live at portal.alisasoftware.fi

The screenshot displays the ALISA Software Portal interface. At the top, the navigation bar includes the ALISA Software logo, links for Product, Shipping labels, Use cases, Getting started, and Contact, along with Sign in and a Book a demo button. A central banner features the headline "All your carriers, one shipment form." and a sub-headline "Multi-carrier shipping software for e-commerce and logistics companies. Book parcels and freight with the carriers you already use, print labels and track every shipment in one place." Below the banner are buttons for "Book a demo" and "Write to us". The main content area shows the "New Shipment" form, which is divided into three steps: 1. Shipment Details (active), 2. Address Details, and 3. Package Details. The "Shipment Details" section includes fields for "Pickup mode" (with options: Carrier, Self-delivery, Client pick-up), "Order number" (with value: WEB-2026-010418), "Transportation service" (with value: Pakettipiste), and "Service" (with value: Pakettipiste Express). There are also sections for "WHAT FIN ALLOWS" (listing various package types like Parcel, Envelope, etc.) and "EXTRA SERVICES" (listing various services like Insurance, etc.).

Multi-carrier shipping software

React · TypeScript · Python · Node.js · PostgreSQL · MongoDB · Kubernetes

As the founding engineer, I develop the product end to end, working directly with the business lead, customers, and developers from partner shipping companies.

[ALISA Software, in detail]

Creating a shipment

A guided, step-by-step flow across our carrier integrations, so a long multi-carrier booking stays easy to complete.

Application for controlling ships remotely

React · TypeScript · C++ · WebSockets · OpenBridge Design System

Screens for operating vessels from shore and on the bridge, where clarity is a safety requirement, not a nice-to-have.

Application for controlling ships remotely

I lead the frontend development, the real-time data integration, and the shared component library behind the new UI.

Project configuration tool

React · TypeScript · Django · Python

An internal tool for vessel configuration that replaced the legacy application. Form fields respond to real-time choices, so 500+ interdependent settings stay consistent as a project takes shape.

Redesigning a legacy application

The redesign made the same work faster and easier to trust.
I rebuilt it around a set of custom components and UX patterns, keeping the familiar workflow people already knew.

THE LEGACY TOOL

- Additional Equipment

I build software and improve how it gets built.

Alongside building products, I develop reusable workflows around agentic tooling, custom skills, and MCP integrations. These connect agents to project documentation, databases, and cloud infrastructure, with verification and review built into the process.

Less repetitive work

I turn API documentation into structured project guidance, then use it in repeatable workflows for implementing and verifying integrations.

Automation with checks built in

I build verification and review into these workflows, checking changes against the requirements and how the application actually behaves.

Keeping context together

I document project conventions and decisions so developers and agents can work from the same information and understand the reasoning behind it.

Useful beyond my own setup

I introduced agentic tooling and my own workflows to the development team at Navis Engineering, and helped bring it into our everyday work.

[Thank you for reading]

Let's talk.

If any of this resonates, I'd be glad to hear from you.
